NEBIUS × NVIDIA GLOBAL AI HACKATHON · BEST APPS AND AGENTS

Northbridge Brief

A quiet household agent. Routine bills are handled silently. Real decisions get one short brief with cited web sources.

Nebius Token Factory | Nemotron 3 Nano · Super · Ultra | Tavily search + extract | Next.js / TypeScript | Vercel

Demo household: Avery & Morgan (pseudonyms) · github.com/dl88jing/northbridge-nebius-brief

THE PROBLEM

Bills hide duplicates, price bumps and surprises

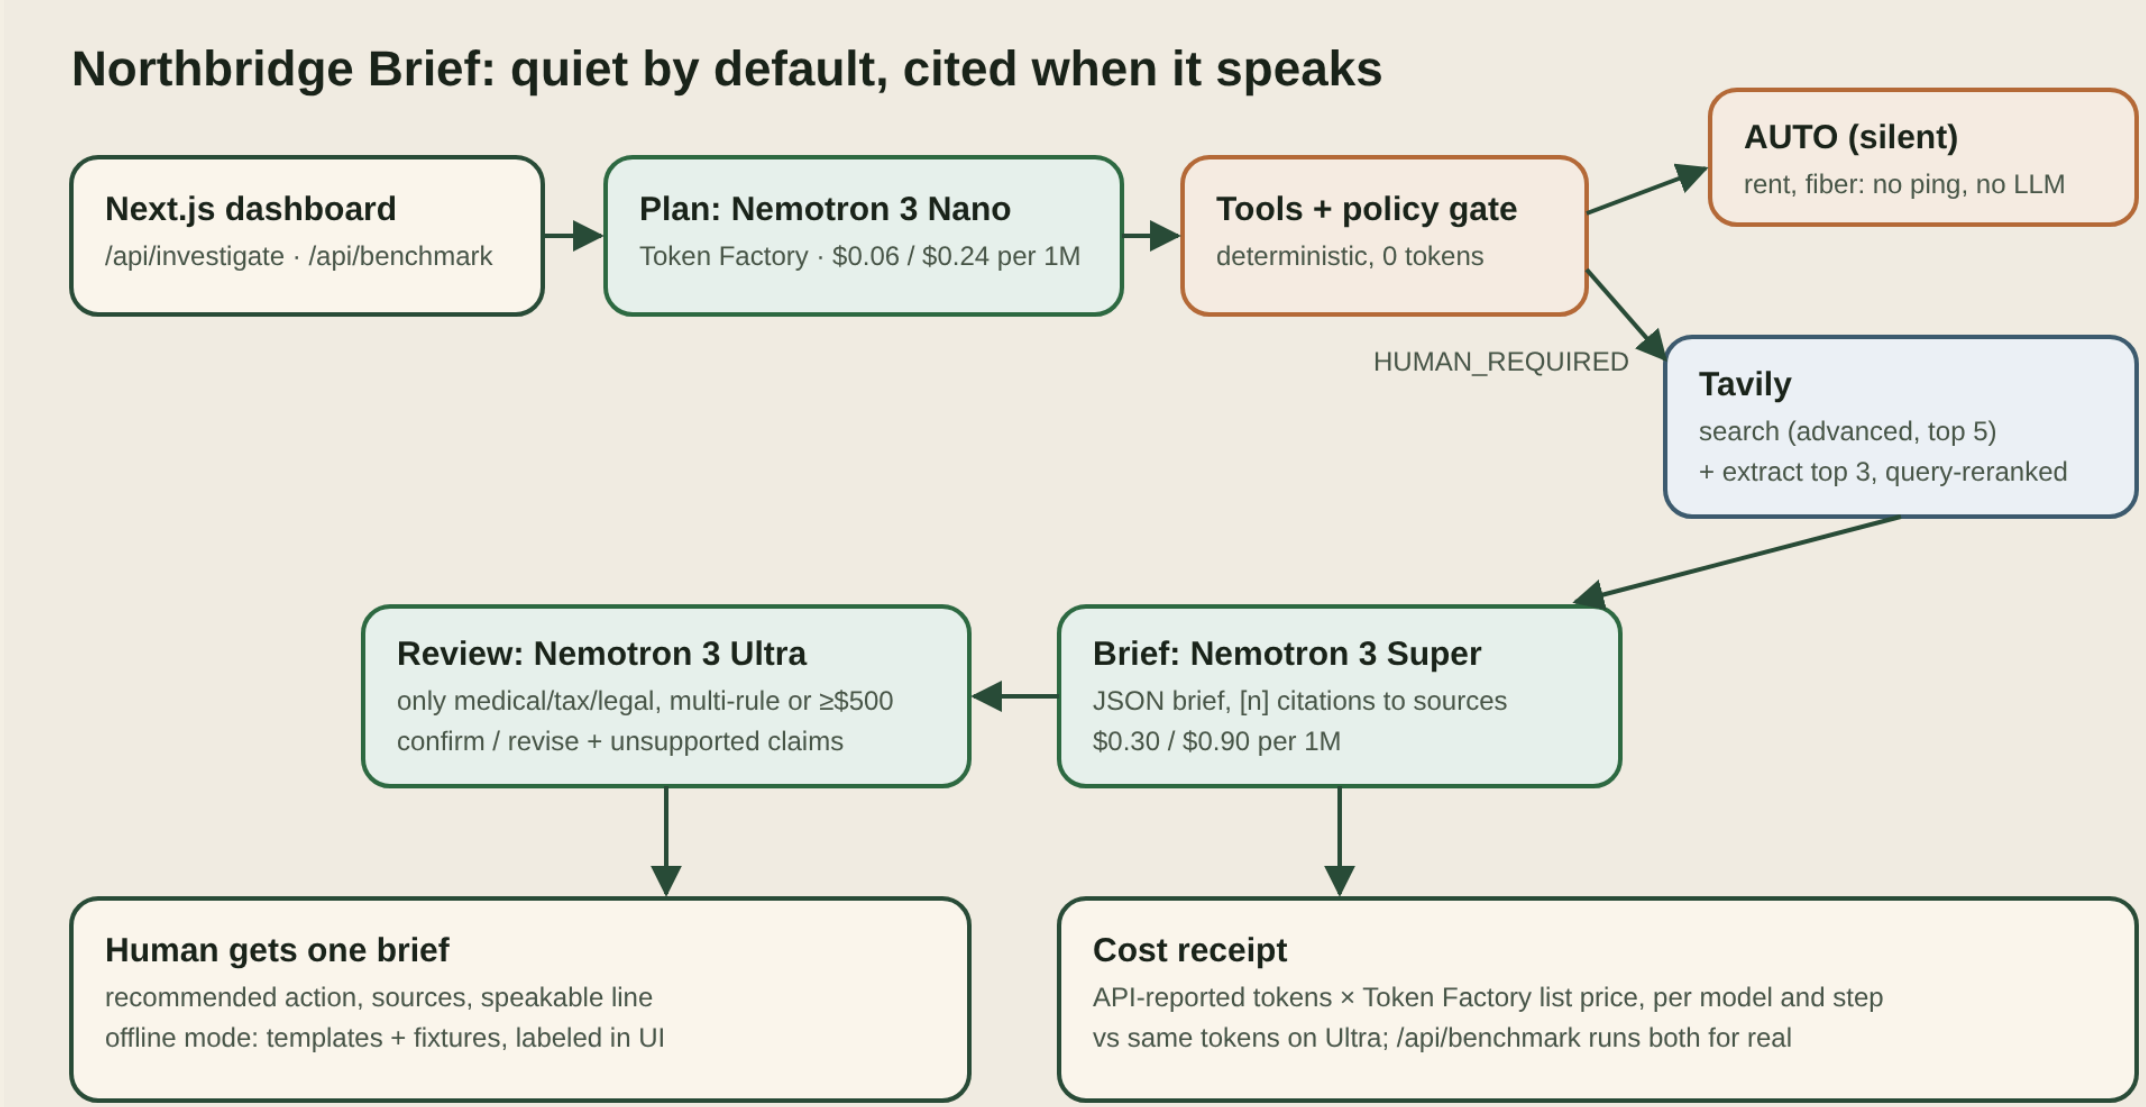

- Checking every bill is a chore, so people stop checking.
- Finance chatbots are noisy: they ping about everything.
- When something is wrong you still have to research what changed.

THE IDEA

Quiet by default, cited when it speaks

- Deterministic policy gate decides AUTO vs HUMAN_REQUIRED. No LLM, no tokens.
- Escalations get Tavily research: search, then extract the top pages.
- Nemotron Super writes the brief with [n] citations.
- Nemotron Ultra reviews only high-stakes briefs (medical, multi-rule, ≥$500).

ARCHITECTURE

MODEL ROUTING

Right-size every step

Step	Runs on	List price per 1M (in / out)
Policy gate	Rules	$0
Plan	Nemotron 3 Nano	$0.06 / $0.24
Brief	Nemotron 3 Super	$0.30 / $0.90
Escalation review	Nemotron 3 Ultra	$1.00 / $3.00

Each step in the UI shows its model, API-reported tokens, latency and cost. The app also compares against the same run on Ultra only. Prices: Token Factory public catalog, 2026-10-25.

MEASURED, LIVE

What one run really costs

Oct 25, 2026 · production	Routed	All on Ultra
Side-by-side benchmark (same sources)	$0.00459 · 8,066 tok	$0.01327 · 8,651 tok
Saving	65.4% cheaper (about $4.59 vs $13.27 per 1,000 runs)	
Full pass, 6 bills	6 Token Factory calls · ~8–11 s · 9 Tavily credits	

Live on Token Factory + Tavily. Costs are API-reported tokens × list price; single runs, not averages. If a provider fails, that step uses a labeled fallback and the run still completes. Limits: fictional household, no bank connection, nothing is paid.

TRY IT

Run it in 30 seconds
